**Martin Scharlemann\*** ([mgscharl@math.ucsb.edu](mailto:mgscharl@math.ucsb.edu)), Mathematics Department MC3080,  
University of California, Santa Barbara, CA 93105-3080. *Proposed Property 2R counterexamples  
classified.*

Earlier work with Robert Gompf and Abigail Thompson classified, via a natural slope indexed by  $\mathbb{Q}$ , all two-component links which contain the square knot and from which  $(S^1 \times S^2) \# (S^1 \times S^2)$  can be obtained by surgery. It was argued there that each of a certain family  $L_n$  of such links probably contradicts the Generalized Property R Conjecture. Left unresolved was how the family  $L_n$  fits into the classification scheme. This question is resolved here, in part by giving varied perspectives and more detail on the construction of the  $L_n$ . (Received August 27, 2012)
