**Flavia C Sancier-Barbosa\*** ([fsancier@antiochcollege.edu](mailto:fsancier@antiochcollege.edu)). *Simulating Option Pricing Models with Hereditary Structure.*

We discuss the derivation and simulation of continuous option pricing models that have stochastic volatility with hereditary structure. That is, the stock dynamics follows a nonlinear stochastic functional differential equation. In particular, two models are discussed: one in which the drift and volatility terms have a continuous dependence on past stock prices, and one in which the continuous past dependence may include present stock prices. The models are an extension of the well-known Black-Scholes framework. The option pricing formulas are the result of an equivalent (local) martingale measure and therefore are written as conditional expectations that can be simulated via Monte Carlo methods.
