Martin William Montgomery* (montgome@noether.uoregon.edu), Department of Mathematics, 1222 University of Oregon, Eugene, OR 97403-1222. *Projective Resolutions for Cleft Binomial Rings*.

An Artinian ring R with Jacobson radical J is cleft if there is a subring $S \subseteq R$ such that $R = S \oplus J$ as abelian groups and $S \cong R/J$ as rings. Sklar [2000] defines a class of binomial rings which includes the classes of monomial rings, square-free rings, and binomial algebras. Here we extend the results of Anick and Green [1987] to find a method of constructing projective resolutions for certain simple modules over cleft binomial rings. In particular, this technique applies to arbitrary square-free rings and provides a bound on global dimension. (Received September 26, 2005)
