Gragg** (gragg@nps.edu), Department of Applied Mathematics, Naval Postgraduate School, Monterey, CA 93943. *An optimization framework for polynomial zerofinders.*

We show a correspondence between several classical methods for the computation of the zeros of a polynomial and a constrained optimization problem. In addition to providing a framework for the construction of new methods, it allows one to obtain overshooting properties for these methods. We have applied our results to the computation of eigenvalues of symmetric Toeplitz matrices. (Received September 26, 2005)
