We examine the action of the Cartier operator on the vector space of regular differential forms on cyclic covers of the projective line in positive characteristic \( p \) and implications of “periodicity” of this actions on invariants of \( p \)-torsion of the jacobian varieties of these curves. Specifically, we will give an upper bound on the \( a \)-number of these curves that improves upon a similar bound by Ricardo Re. (Received September 13, 2008)
