The Balian-Low Theorem (BLT) is a strong form of the uncertainty principle for Gabor systems that form orthonormal bases or Riesz bases for $L^2(\mathbb{R})$. We investigate the Balian-Low theorem in the settings of (1) exact systems, and (2) Schauder bases. We prove a new nonsymmetrically weighted Balian-Low theorem for Gabor systems that are complete and minimal. We also discuss how Gabor Schauder bases relate to the Balian-Low theorem, and characterize a class of Gabor Schauder bases in terms of the Zak transform and product $A_2$ weights.
