tableaux and subvarieties of the Grassmannian.*

The Wronski map from a Grassmannian to projective space gives a way to label certain points on the Grassmannian by standard Young tableaux. One can use this correspondence to define subvarieties of the Grassmannian from a tableau or a class of tableaux. This perspective provides a direct link between geometric and combinatorial properties of these subvarieties. We will discuss a few of interesting examples, including the orthogonal and Lagrangian Grassmannians. (Received September 17, 2013)
