Katie Anders* (kanders@uttyler.edu) and **Kassie Archer**. *Unimodal rooted forests*.

We say that an unordered rooted labeled forest avoids the pattern $\pi \in S_n$ if the sequence obtained from the labels along the path from the root to any vertex does not contain a subsequence that is in the same relative order as π . We enumerate the class of forests that avoid $\{312, 213\}$, which are the unimodal forests, via a bijection with the set of ordered cycle decompositions of permutations in S_n .
