Thomas McKenzie* (mckenzie@gonzaga.edu). *The book thickness of zero divisor graphs with genus at most one.* Preliminary report.

Let R be a finite commutative ring with identity. We form the zero divisor graph of R by taking the nonzero zero divisors as the vertices and connecting two vertices, x and y , by an edge if and only if $xy = 0$. We determine the book thickness of all zero divisor graphs with genus at most one. (Received September 21, 2015)
