**Stephan Ramon Garcia\*** ([stephan.garcia@pomona.edu](mailto:stephan.garcia@pomona.edu)), 610 N College Ave, Claremont, CA 91711. *Nonvanishing Minors and Uncertainty Principles.*

Fourier uncertainty principles play a major role in harmonic analysis, mathematical physics, and number theory. In 2005, Tao used a nonvanishing minors result for the DFT matrix to establish the best possible Fourier uncertainty principle for fields of prime order, a result independently discovered by Biró and Meshulam. We prove an optimal generalization of the BMT principle for functions that enjoy certain symmetries. The discrete cosine matrix and its generalizations play a central role. This is joint work with D. Katz and G. Karaali. (Received August 07, 2019)
